

Converting

example

```
INSPECT StringData
```

```
CONVERTING "fxtd" TO "ZYAB".
```

Each subject character is associated with its target character

INSPECT `StringData`

CONVERTING `"fxtd"` TO `"ZYAB"`.

Each subject character is associated with its target character

INSPECT StringData

CONVERTING "fxtd" TO "ZYAB".

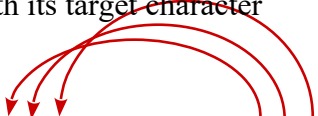

The diagram consists of two red curved arrows. The first arrow starts at the 'f' in 'fxtd' and points to the 'Z' in 'ZYAB'. The second arrow starts at the 'x' in 'fxtd' and points to the 'Y' in 'ZYAB'. The target string 'ZYAB' is written in red, while the source string 'fxtd' is in black.

Each subject character is associated with its target character

INSPECT `StringData`

CONVERTING `"fxtd"` TO `"ZYAB"`.

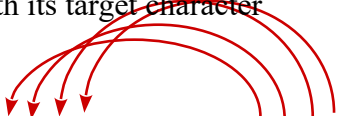

The diagram consists of four red curved arrows mapping characters from the source string "fxtd" to the target string "ZYAB". The first arrow maps 'f' to 'Z', the second maps 'x' to 'Y', the third maps 't' to 'A', and the fourth maps 'd' to 'B'. The target string "ZYAB" is rendered in red text.

Each subject character is associated with its target character

INSPECT StringData

CONVERTING "fxtd" TO "ZYAB".

The diagram illustrates the character mapping process. Four red curved arrows originate from the characters 'f', 'x', 't', and 'd' in the string "fxtd" and point to the characters 'Z', 'Y', 'A', and 'B' respectively in the string "ZYAB". The target string "ZYAB" is rendered in red, while the source string "fxtd" is in black.

Before 1

```
