

1 2 3 4 5 6 7

```
01 TextValue      PIC X(7) .
```

```
01 NumericValue  REDEFINES TextValue PIC 9(5)V99.
```

When we refer to TextValue, the value is treated as if it were an alphanumeric value. For instance, the compiler will reject a statement like IF *TextValue* = 1234567.

1 2 3 4 5 6 7

```
01 TextValue PIC X(7) .
```

```
01 NumericValue REDEFINES TextValue PIC 9(5)V99.
```

When we refer to NumericValue, the value is treated as if it were an numeric value with 2 decimal places. In this case a statement like -

IF NumericValue = 1234567

does not cause the compiler any problems but the statement evaluates to FALSE.

IF NumericValue = 12345.67 is TRUE

y	h	

We can accept dates with different formats into the same area of storage and as long as we know what type of date has been entered we can access the day, month and year correctly.
